

- Preserves nutrients, natural flavour and mineral integrity

For an athlete, these details matter.

This is the difference between magnesium supporting sleep and cramps interrupting training. Between eating 'healthy' and actually absorbing nutrition.

If you'd like to see the cookware I personally use and trust, you can visit ryanfernando.in and head to the Ryan Recommends section. You'll find my recommendation there, along with a direct way to connect through my website for further details.

Time is a real constraint for athletes

One reason athletes rely on food delivery is time. I understand that. Training schedules are demanding. Recovery work is non-negotiable. Cooking must fit life, not dominate it.

Smart induction systems that regulate temperature and switch off automatically allow athletes to cook without supervision. Meals finish while you stretch, shower or prep for the day.

Over the years, I have learned that consistency beats perfection. Technology that supports consistency supports performance.

No compromises here.

Cookware should protect nutrients, not contaminate them. This is especially important for athletes who eat high volumes of food daily.

The oil conversation athletes avoid

In my early years, I rarely challenged oil usage. It seemed harmless. Experience corrected me.

One tablespoon of oil adds about 120 calories with no performance benefit. Used across multiple meals, it creates an energy mismatch without micronutrient gain.

More importantly, overheated oils generate oxidative compounds that increase inflammation and insulin resistance.

For athletes, this shows up as delayed recovery, joint discomfort and inconsistent energy during training. I have seen lipid profiles improve and body fat drop without changing food quantity, simply by changing how food was cooked.

Why I push oil-free cooking with my clients

When athletes transition to oil-free or minimal-oil cooking, the change is not subtle. Digestion improves. Energy stabilises.

Training sessions feel cleaner. Recovery accelerates.

Removing oil from cooking does four things consistently in my practice:

- It removes excess calories without reducing food volume.
- It protects fats from oxidation.
- It preserves micronutrients that drive recovery.
- It reduces gut inflammation that sabotages consistency.

The challenge used to be taste and time. That has changed.

You cannot out-train or out-supplement bad cooking

This is one of the hardest truths athletes accept. Supplements cannot fix nutrients destroyed at the stove. Training cannot override chronic inflammation from poor cooking practices.

When cooking improves,

Over the flame: Technology that supports consistency supports performance. For example, cookware should protect nutrients, not contaminate them. This is especially important for athletes. REPRESENTATIVE

supplementation often reduces naturally.

Blood reports stabilise.

Performance becomes predictable.

After 20 years in this field, I no longer separate nutrition from cooking. They are the same system.

Where performance truly begins

So now, when athletes ask me how to gain an edge without increasing their training load, my answer has evolved.

"Look at what happens before the plate reaches the table." If your cooking preserves nutrients, your body adapts faster. If it destroys them, no programme can save you.

Performance does not begin at warm-up. It begins in the kitchen — quietly, consistently, every single day.
