

Project 36, Hourglass: A simple physics engine for falling sand. <i>Simulate gravity and use collision detection.</i>	165
Project 37, Hungry Robots: Avoid killer robots in a maze. <i>Create a simple AI for robot movements.</i>	171
Project 38, J'Accuse!: A detective game to determine liars and truth-tellers. <i>Use data structures to generate relationships between suspects, places, and item clues.</i>	178
Project 39, Langton's Ant: A cellular automata whose ants move according to simple rules. <i>Explore how simple rules create complex graphical patterns.</i>	186
Project 40, Leetspeak: Translate English messages into l33t5p34]<. <i>Use text parsing and string manipulation.</i>	192
Project 41, Lucky Stars: A push-your-luck dice game. <i>Practice ASCII art and probability.</i>	195
Project 42, Magic Fortune Ball: A program to answer your yes/no questions about the future. <i>Add cosmetic features to make basic text appear more interesting.</i>	202
Project 43, Mancala: The ancient two-player board game from Mesopotamia. <i>Use ASCII art and string templates to draw a board game.</i>	206
Project 44, Maze Runner 2D: Try to escape a maze. <i>Read maze data from text files.</i>	213
Project 45, Maze Runner 3D: Try to escape a maze . . . in 3D! <i>Modify multiline strings to display a 3D view.</i>	219
Project 46, Million Dice Roll Statistics Simulator: Explore the probability results of rolling a set of dice one million times. <i>Learn how computers crunch large quantities of numbers.</i>	228
Project 47, Mondrian Art Generator: Create geometric drawings in the style of Piet Mondrian. <i>Implement an art-generating algorithm.</i>	231
Project 48, Monty Hall Problem: A simulation of the Monty Hall game show problem. <i>Examine probability with ASCII-art goats.</i>	238
