

## The Program in Action

When you run *fourinarow.py*, the output will look like this:

---

Four in a Row, by Al Sweigart al@inventwithpython.com

--snip--

```
1234567
+-----+
| .....|
| .....|
| .....|
| .....|
| .....|
| .....|
+-----+
```

Player X, enter a column or QUIT:

> 3

```
1234567
+-----+
| .....|
| .....|
| .....|
| .....|
| .....|
| ..X...|
+-----+
```

Player O, enter a column or QUIT:

> 5

--snip--

Player O, enter a column or QUIT:

> 4

```
1234567
+-----+
| .....|
| .....|
| XXX.XO|
| OOOOXO|
| OOOXOX|
| OXXXOXX|
+-----+
```

Player O has won!

---

## How It Works

The board game projects in this book follow a similar program structure. There's often a dictionary or list for representing the state of the board, a `getNewBoard()` function that returns a data structure for a board, a `displayBoard()` function for rendering a board data structure on the screen, and so on. You can check out the other projects in this book with the *board game* tag and compare them with each other, especially when you want to create your own original board game programs.
