BITMAP MESSAGE

This program uses a multiline string as a *bitmap*, a 2D image with only two possible colors for each pixel, to determine how it should display a message from the user. In this bitmap, space characters represent an empty space, and all other characters are replaced by characters in the user's message. The provided bitmap resembles a world map, but you can change this to any image you'd like. The binary simplicity of the space-or-message-characters system makes it good for beginners. Try experimenting with different messages to see what the results look like!
