

```
>>> int('11', 16)
17
```

When calling the `chr()` function, you must pass a decimal integer as the argument, not a hexadecimal string.

Table of Code Points

The following are all the Unicode code points in the set known as Windows Glyph List 4, which are the characters supported by the Windows terminal program, Command Prompt. Both macOS and Linux can display more characters than are in this list, but to keep your Python programs compatible, I recommend you stick to the characters in this table.
