

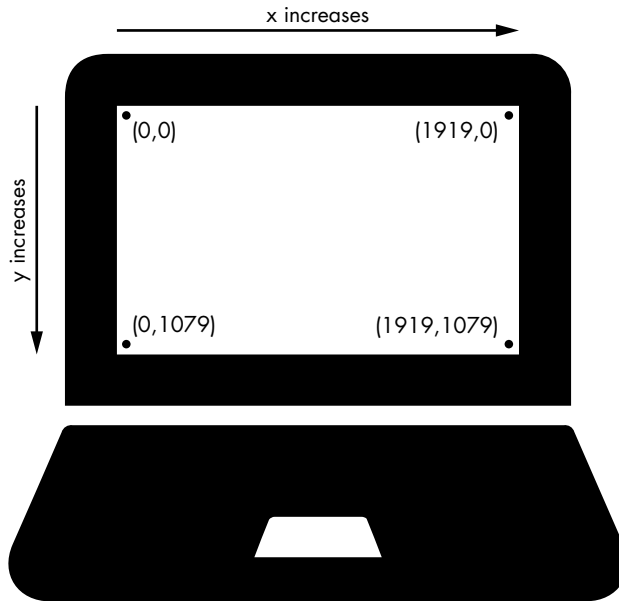

Figure 5-2: The origin point (0, 0) is in the upper left of the screen, while the x- and y-coordinates increase going right and down, respectively.

The `bext` module's `goto()` function works the same way: calling `bext.goto(0, 0)` places the text cursor at the top left of the terminal window. We represent each bouncing DVD logo using a Python dictionary with the keys 'color', 'direction', 'x', and 'y'. The values for the 'x' and 'y' are integers representing the logo's position in the window. Since these values get passed to `bext.goto()`, increasing them will move the logo right and down, while decreasing them will move the logo left and up.
