

The Program in Action

When you run *calendarmaker.py*, the output will look like this:

```
Calendar Maker, by Al Sweigart al@inventwithpython.com
Enter the year for the calendar:
> 2029
Enter the month for the calendar, 1-12:
> 12

                        December 2029
...Sunday....Monday....Tuesday...Wednesday...Thursday....Friday....Saturday..
+-----+-----+-----+-----+-----+-----+-----+
| 25     | 26     | 27     | 28     | 29     | 30     | 1      |
|        |        |        |        |        |        |        |
+-----+-----+-----+-----+-----+-----+-----+
| 2      | 3      | 4      | 5      | 6      | 7      | 8      |
|        |        |        |        |        |        |        |
+-----+-----+-----+-----+-----+-----+-----+
| 9      | 10     | 11     | 12     | 13     | 14     | 15     |
|        |        |        |        |        |        |        |
+-----+-----+-----+-----+-----+-----+-----+
| 16     | 17     | 18     | 19     | 20     | 21     | 22     |
|        |        |        |        |        |        |        |
+-----+-----+-----+-----+-----+-----+-----+
| 23     | 24     | 25     | 26     | 27     | 28     | 29     |
|        |        |        |        |        |        |        |
+-----+-----+-----+-----+-----+-----+-----+
| 30     | 31     | 1      | 2      | 3      | 4      | 5      |
|        |        |        |        |        |        |        |
+-----+-----+-----+-----+-----+-----+-----+

```

How It Works

Note that the `getCalendarFor()` function returns a giant multiline string of the calendar for the given month and year. In this function, the `calText` variable stores this string, which adds the lines, spaces, and dates to it. To track the date, the `currentDate` variable holds a `datetime.date()` object, which gets
