

The Program in Action

When you run *chohan.py*, the output will look like this:

Cho-Han, by Al Sweigart al@inventwithpython.com

In this traditional Japanese dice game, two dice are rolled in a bamboo cup by the dealer sitting on the floor. The player must guess if the dice total to an even (cho) or odd (han) number.

You have 5000 mon. How much do you bet? (or QUIT)

> **400**

The dealer swirls the cup and you hear the rattle of dice.

The dealer slams the cup on the floor, still covering the dice and asks for your bet.

CHO (even) or HAN (odd)?

> **cho**

The dealer lifts the cup to reveal:

GO - GO

5 - 5

You won! You take 800 mon.

The house collects a 40 mon fee.

--snip--

How It Works

The `random.randint(1, 6)` call returns a random integer between 1 and 6, making it ideal for representing a six-sided die roll. However, we also need to display the Japanese words for the numbers one to six. Instead of having an if statement followed by five elif statements, we have a dictionary, stored in `JAPANESE_NUMBERS`, that maps the integers 1 to 6 to strings of the Japanese words. This is how line 57's `JAPANESE_NUMBERS[dice1]` and `JAPANESE_NUMBERS[dice2]` can display the Japanese words for the dice results in just one line of code.
