

Django Models – DateField with datetime Module

models.py

```
import datetime

class Employee:
    field_name = models.DateField(default=datetime.date.today,...)
```

- 1 Import "datetime" module
- 2 Add field using DateField type
- 3 Add default option using today function

Change employee

HISTORY

Floyd Miles

Employee Name:

Floyd Miles

Learning Priorities: Medium

Data Registration Date: 2023-03-23 Today

Note: You are 8 hours ahead of server time.

For database management, you may want to record the data registration date. The easiest way to set a **timestamp** is using the `auto_now_add` argument in `DateField`. However, when you use `auto_now_add=True`, the field becomes uneditable and is not shown on the Django admin page. On this lesson, we'll explain how to make a date timestamp which is editable and is shown in the Django admin page.

There are three points to implement it.

- **Import the datetime module:** To use the `today` function, you need to import the `datetime` module first.
