

Django Models – ForeignKey (OneToMany Relationship)

models.py

```
models.ForeignKey(RelatedModel, on_delete=xx)
```

To make a **One-To-Many** relationship, Django uses `ForeignKey`. There are two key arguments you need to specify.

1. **Related model name**

2. **On_delete argument**

As explained on the previous page, by specifying a related model name through the `ForeignKey` field, Django connects the field with the ID of the related model. The `on_delete` argument is used to define the behavior when an object of the related model is deleted.

There are three possible values for the `on_delete` argument.
