

4. Migrate the model into the database and run the runserver

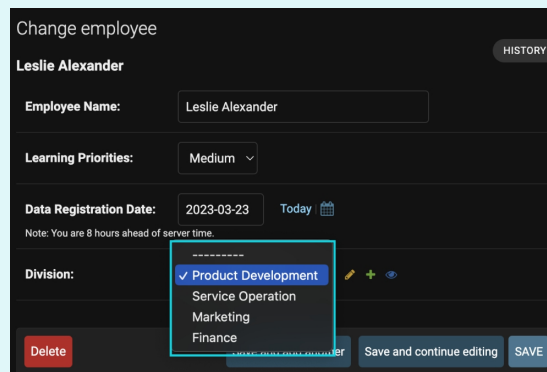

Complete the `migration` and run the `runserver` command.

Command Line - INPUT

```
(d_env) project_d % | python manage.py migrate
(d_env) project_d % | python manage.py runserver
```

5. Check the Django admin site

You can see that the *Division* model and the *Employee* model are connected. The employee model also reflects the data as we temporality input "1" for existing data. ID:1 is "*Product Development*" in this case.

The screenshot shows the 'Change employee' form in the Django Admin interface. The form is for an employee named 'Leslie Alexander'. The 'Employee Name' field is filled with 'Leslie Alexander'. The 'Learning Priorities' dropdown is set to 'Medium'. The 'Data Registration Date' is '2023-03-23'. A note below the date says 'Note: You are 8 hours ahead of server time.' The 'Division' dropdown is open, showing a list of options: 'Product Development' (selected with a checkmark), 'Service Operation', 'Marketing', and 'Finance'. At the bottom of the form, there are buttons for 'Delete', 'Save and continue editing', and 'SAVE'.
