

CRUD Web Application

CRUD is the acronym for **Create**, **Read**, **Update**, and **Delete**. The four functions represent the minimum operations used in database applications.

- **Create (C):** Creates new data records in the system. For example, in blog applications, bloggers post their blog articles, and the system registers the posted article.
- **Read (R):** Read (retrieves) existing data records in the system. For example, the system retrieves posted articles to display them.
- **Update (U):** Updates existing data records. For example, bloggers update their posted blog articles, and the system updates the record.
