

detail.html

```
{% for emp in object.employee.all %}

    {{ emp.name }}
    {{ emp.division }}

{% endfor %}
```

Use `all()` method to retrieve all objects under employee model

Practice

Objective:

Learn how to handle `ManyToManyField` in the detail page template

In this practice, we'll show different codes for `ManyToManyField` in the detail page template and the corresponding results.

1. Without the `all()` method and the `for` statement

Open the `course_detail.html` file, add the **yellow** lines below, and save the file.

templates/employee_learning/course_detail.html

```
:
<p>Course Title : {{ course_object.title|upper }}
</p>
<p>Level : {{ course_object.get_level_display }}
</p>

<p>Assigned Employees : <p>
<p>{{ object.employee }}</p>
```

Go to one of the detail pages. You'll see that the browser doesn't show the employee data properly.
