

Check Developing App UI on Mobile Device

```
python manage.py runserver [Local IP address:Port]
```

settings.py

```
ALLOWED_HOSTS = ["Local IP address"]
```

During web application development, you may also want to check the in-progress design on mobile devices. Using a local IP address, you can browse the app you are developing. Here are the key steps on how to do it.

1. Check your local IP address

There are several ways to check your local IP address.

Check through the command line

First, you can check it from the command line. Run the `ifconfig` command (`ipconfig` command for Windows). As the command displays a lot of lines, you may need to search it with "192" by
