

Advanced...

3. Go to the wifi setting and check the TCP/IP tab

2. Edit settings.py – add the IP address under ALLOWED_HOSTS

Open the `settings.py` file and edit the `ALLOWED_HOSTS` section like shown below. The reason for also adding `"localhost"` is that you may want to run the `runserver` command using the `localhost` address. If you don't add `"localhost"` while adding another IP address, you cannot use the app using the `localhost` address.

`config/settings.py`

```
ALLOWED_HOSTS = ["localhost", "192.168.xx.xx"]
```

3. Execute the runserver command with specifying IP address and port

Go to the project directory in your terminal and execute the command like shown below.

Command Line - INPUT

```
python manage.py runserver 192.168.86.96:8000
```
