

Customizing Views (2) – Filter Lists

views.py

```
queryset =  
    ModelName.objects.filter(field='keyword')
```

Filter data

contains 'keyword'	➡ <code>filter(field__contains='keyword')</code>
start with 'keyword'	➡ <code>filter(field__startswith='keyword')</code>
end with 'keyword'	➡ <code>filter(field__endswith='keyword')</code>
greater than 'number or string'	➡ <code>filter(field__gt='keyword')</code>
greater than & equal to 'number or string'	➡ <code>filter(field__gte='keyword')</code>
lower than 'number or string'	➡ <code>filter(field__lt='keyword')</code>
lower than & equal to 'number or string'	➡ <code>filter(field__lte='keyword')</code>

Using the `queryset` attribute and the `filter` method, you can filter the list shown on the list page. Here we'll explain how to use them with the employee learning app example.

Filter objects with the field that matches a keyword

To display only basic-level courses, edit the `CourseList` view by adding the **yellow** part of the code below. Also, comment out the previous one.

employee_learning/views.py

```
class CourseList(ListView):  
    # model = LearningCourse  
    # queryset = LearningCourse.objects.order_by('-title')  
    queryset = LearningCourse.objects.filter(level='B')  
    :
```

You can see that only basic courses are shown.
