

Context

Context is a frequently used word when you write views. It is a set of dictionary-type data mapping variable names to variable values that are transferred from views to templates.

Check context data in your terminal

To understand the concept of context, let's print the context data for the list page.

Add the **yellow** part in the CourseList view code, which redirects the output (the context data for the list page) to your terminal.

employee_learning/views.py

```
class CourseList(ListView):
    # model = LearningCourse
    # queryset = LearningCourse.objects.order_by('-title')
    queryset =
        LearningCourse.objects.filter(title__contains='Docker')
```
