

STATIC_URL and STATICFILES_DIRS

`STATIC_URL` defines the URL that is linked with the project directory location(s) defined by `STATICFILES_DIRS`. We'll explain how `STATIC_URL` and `STATICFILES_DIRS` work in this lesson.

The `static` directory is usually set directly under the project directory, but you can also set it under each app. You can set multiple `static` directories, and Django handles the `static` files in different `static` directories as if they are under the same directory.

For example, when there is an HTTP request `'localhost:8000/static/img-1.jpg'` like in the main figure, Django gets the resource from the `static` directory under the *project directory*.
