

Usually, web applications have a page to manage user profiles. Unlike the primary user management functions, the user profile page design is more free-form.

5. Social login

The **social login** is an approach for user authentication via existing online service accounts such as Google, GitHub, or Facebook accounts. By using the social login feature, a web app's user management process can be simplified, and the users can avoid managing their passwords and user profiles. Social login is a common feature in many web applications.
