

# Production Database Setup

To change a database from the default database **SQLite**, you need to install database software that you want to use in the production stage (e.g., **PostgreSQL**). You also need to do the initial setup for the database.

**Note: Most actions from this lesson must be done on the Ubuntu instance. Make sure that you are connected to the remote server via SSH.**

## 1. Install PostgreSQL on the instance

Based on the PostgreSQL official documentation, you can install PostgreSQL in the following steps.
