

Domain Setup

Accessing your web app using only an IP address is not user-friendly. To make your web app accessible through your domain, register your domain and attach the domain to the IP address.

There are five steps to complete this process to set up a domain for your app on the Lightsail platform.

- 1. Buy and register your own domain**
- 2. Create a DNS zone in the Lightsail console (Obtain NS records)**
- 3. Assign the domain to the static IP address in the Lightsail console (Adding an A record to the DNS zone)**
- 4. Register the NS records at the DNS hosting provider**
