

When you run the command, you can see that many files are created under the new app directory.

migrations directory

When you run the `startapp` command, only the `__init__.py` file is created in this directory. This directory is used to store migration files. When you run the `makemigration` command, a new migration file is created.

`__init__.py`

As explained in the Start Django Project section, this is a particular file for Python programming used to mark a directory as a Python package. Often, that file has no content. In regular use, you don't need to touch this file.
