

Add URL Patterns

In the previous section, we prepared two views using a **function-based view** and a **class-based view**; however, those views are not linked with URLs yet. In this section, we'll add URL patterns for the views.

Add 'include' in the `urls.py` file

At this stage, there is only one `urls.py` created by the `django-admin startproject` command. The best practice to write URL patterns that are specific to the app is by creating a new `urls.py` file under the app directory. This is because you may add other apps to the project later. (We'll explain the app structure in the next section.)

The code below is an example of editing the main `urls.py` file. The **yellow** parts of the code are added in this example.

The key points here are:
