

appendix C

Django template tag and filter reference

This appendix is a reference guide for the built-in tags and filters available in the Django template language. For a full reference, see the online documentation: <https://docs.djangoproject.com/en/dev/ref/templates/builtins/>.

C.1 Tags

Table C.1 Built-in Django template tags

Tag	Description
<pre>{% autoescape off %} {{ venue_listing }} {% endautoescape %}</pre>	By default, Django escapes characters in variables that are reserved for HTML. The <code>{% autoescape %}</code> tag allows you to control this behavior by turning it on or off for a block. In this example, if <code>{{ venue_listing }}</code> contained HTML tags, they could be rendered without being escaped inside <code>{% autoescape off %}</code> . <code>{% autoescape %}</code> expects an argument of either <code>on</code> or <code>off</code> .
<pre>{% block footer %} {{ block.super }} {% endblock %}</pre>	Declare a block to be used in inheritance. Templates that extend other templates can override the contents by declaring a <code>{% block %}</code> with the same name— <code>footer</code> , in this example. Within a block, a special variable <code>{{ block.super }}</code> is available that contains the content of parent block.
<pre>{% comment "Optional note" %} This content is not rendered {% endcomment %}</pre>	The contents of a <code>{% comment %}</code> block are not included in the rendered content. This tag takes an optional argument that can be used as an additional note, which can be handy if you're commenting out a chunk of code and want to remind yourself why you did so. Comment blocks cannot be nested. The template language also supports the <code>{# and #}</code> pair as comment characters.
