

Table C.3 Built-in Django template filters (*continued*)

Filter	Description
<code>{{ value unordered_list }}</code>	This converts a list into a series of <code></code> tags. It supports nested lists with inner lists converted into a sub <code></code> collection. Note that the outermost output does not have <code></code> tags wrapped around it.
<code>{{ value upper }}</code>	This converts a string into all uppercase.
<code>{{ value urlencode }}</code>	URL encodes a string.
<code>{{ value urlize }}</code>	This converts text containing a URL into its clickable HTML equivalent. URLs are detected based on prefixes of <code>www.</code> , <code>http://</code> , or <code>https://</code> . Additionally, domain-only links are detected if they end in a recognized top-level domain (<code>.com</code> , <code>.edu</code> , <code>.gov</code> , <code>.int</code> , <code>.mil</code> , <code>.net</code> , or <code>.org</code>). Note that <code>value</code> may contain content besides the URL, such as a full sentence. For example 'Visit manning.com today' is converted to 'Visit <code>manning.com</code> today'.
<code>{{ value urlizetrunc:"15" }}</code>	This is like <code> urlize</code> but truncates the display portion of the URL if it exceeds the length given in the argument.
<code>{{ value wordcount }}</code>	This returns the number of words in <code>value</code> .
<code>{{ value wordwrap:"20" }}</code>	This adds newlines into a string to wrap at the given width.
<code>{{ value yesno }}</code> or <code>{{ value yesno:"yeah,nope" }}</code> or <code>{{ value yesno:"yeah,nope,maybe" }}</code>	This returns <code>yes</code> or <code>no</code> for <code>True</code> or <code>False</code> . An optional argument provides comma-separated alternate values for <code>yes</code> and <code>no</code> . A third value can be included in the argument to check <code>value</code> against <code>None</code> .

C.2.1 Loadable filters

Djangos has built-in filters that are available without using a `{% load %}` tag. Django also ships with other filters inside modules that need to be loaded to be used.

Table C.4 Loadable Django filters

Filter	Module	Description
<code>{{ value apnumber }}</code>	humanize	This returns a number using Associated Press style, where numbers less than 10 are spelled out, while numbers greater or equal to 10 are presented as integers.
<code>{{ value intcomma }}</code>	humanize	This converts an int or float to a string with thousands-based comma separators.
<code>{{ value intword }}</code>	humanize	This converts large values to their written equivalent. For example, 1200000 becomes 1.2 million.
