

Table C.4 Loadable Django filters

Filter	Module	Description
<code>{{ value naturalday }}</code>	humanize	This converts a date into today, yesterday, or tomorrow if applicable; otherwise, it returns the date, using the same format as the <code>{% date %}</code> tag.
<code>{{ value naturaltime }}</code>	humanize	This converts a datetime object into a natural string. Possible results include now, 29 seconds ago, and 1 week, 2 days from now. It uses the <code> timesince</code> format if no conversion is possible.
<code>{{ value ordinal }}</code>	humanize	This converts an integer into its ordinal text equivalent. For example, 1 becomes 1st, 2 becomes 2nd, and so on.
<code>{{ LANGUAGE_CODE language_name }}</code>	i18n	This returns the name of the language for the filtered language code—for example, German.
<code>{{ LANGUAGE_CODE language_name_local }}</code>	i18n	This returns the name of the language in its own language for the filtered language code—for example, Deutsch.
<code>{{ LANGUAGE_CODE language_bidi }}</code>	i18n	This returns True for right-to-left languages and False otherwise.
<code>{{ LANGUAGE_CODE language_name_translated }}</code>	i18n	The name of this language is displayed in the currently active language.
<code>{{ value localize }}</code>	l10n	Forces localization on a single value.
<code>{{ value unlocalize }}</code>	l10n	This disables localization on a single value.
<code>{{ value localtime }}</code>	tz	This forces conversion of value into the local timezone.
<code>{{ value timezone:"America/Toronto" }}</code>	tz	This forces conversion of value into the named timezone.
<code>{{ value utc }}</code>	tz	This forces conversion of value into UTC.
