

Table D.1 Arguments common to all fields

Argument	Description
<code>db_comment</code>	This sets the column comment, if supported by the database.
<code>db_index</code>	When <code>True</code> , this creates a database index for this column. To index across multiple columns, use the <code>Meta.indexes</code> property instead.
<code>db_tablespace</code>	The name of the database tablespace to be used if this field is indexed.
<code>default</code>	This is a default value for this field if no value is provided at construction. This can also be a callable—if so, it is called for each construction of a new object.
<code>editable</code>	When <code>False</code> , this field is not displayed in forms or the Django Admin and is ignored during Model validation. It defaults to <code>True</code> .
<code>error_messages</code>	If provided, this overrides the field's default error messages. It takes a dictionary with a message per key. Error message keys are <code>null</code> , <code>blank</code> , <code>invalid</code> , <code>invalid_choice</code> , <code>unique</code> , and <code>unique_for_date</code> . Other keys may be available for specific Model fields.
<code>help_text</code>	This provides extra help text to be displayed in forms for this field.
<code>primary_key</code>	When <code>True</code> , this marks the field as the primary key in the model. By default, the primary key is the ID field automatically added by Django.
<code>unique</code>	When <code>True</code> , each instance in the table must be unique from all others. Unique fields are automatically indexed.
<code>unique_for_date</code>	This takes the name of another field in the model of type <code>DateField</code> or <code>DateTimeField</code> and ensures the value in this field is unique for that date. For example, the value of a title field must be unique for a corresponding publication date.
<code>unique_for_month</code>	This is similar to <code>unique_for_date</code> but only restricts the month portion of the corresponding date field.
<code>unique_for_year</code>	This is similar to <code>unique_for_date</code> but only restricts the year portion of the corresponding date field.
<code>verbose_name</code>	This provides a human-readable name for the field. If not given, Django generates a value based on the field's name.
<code>validators</code>	This provides a list of validators to run for this field. For a full list of Django validators, see https://docs.djangoproject.com/en/dev/ref/validators/ .
