

3 *Templates*

This chapter covers

- Managing HTML-like code through templates
- Rendering templates based on context data
- Template tags and filters
- Using the `render()` shortcut inside views
- Composing and inheriting templates for HTML reuse

This chapter introduces you to adding HTML content to your website. Django includes a templating engine that can compose and control text content, allowing you to create reusable pieces of HTML, managing it like you would manage your code.

3.1 *Where to use templates*

In the previous chapter, you learned how to start a simple website by creating a Django project. Inside the project, you created your first app and your first view. To keep things simple, an important thing got left out: HTML. A website isn't much of a website without it. The purpose of a Django view is to return content, typically for
