

- Writing short functions often means a larger number of functions in the program.
- Having more functions means the program is more complicated.
- Having more functions also means having to come up with additional descriptive, accurate names, which is a difficult task.
- Using more functions requires you to write more documentation.
- The relationships between functions become more complicated.

Some people take the guideline “the shorter, the better” to an extreme and claim that all functions should be three or four lines of code at most. This is madness. For example, here’s the `getPlayerMove()` function from Chapter 14’s Tower of Hanoi game. The specifics of how this code works are unimportant. Just look at the function’s general structure:

```
def getPlayerMove(towers):
    """Asks the player for a move. Returns (fromTower, toTower)."""

    while True: # Keep asking player until they enter a valid move.
        print('Enter the letters of "from" and "to" towers, or QUIT.')
        print("(e.g. AB to moves a disk from tower A to tower B.)")
        print()
        response = input("> ").upper().strip()

        if response == "QUIT":
            print("Thanks for playing!")
            sys.exit()

        # Make sure the user entered valid tower letters:
        if response not in ("AB", "AC", "BA", "BC", "CA", "CB"):
            print("Enter one of AB, AC, BA, BC, CA, or CB.")
            continue # Ask player again for their move.

        # Use more descriptive variable names:
        fromTower, toTower = response[0], response[1]

        if len(towers[fromTower]) == 0:
            # The "from" tower cannot be an empty tower:
            print("You selected a tower with no disks.")
            continue # Ask player again for their move.
        elif len(towers[toTower]) == 0:
```
