

---

```
C:\Users\Al>cd "Vacation Photos"
```

```
C:\Users\Al\Vacation Photos>
```

---

Another common argument for many commands is `--help` on macOS and Linux and `/?` on Windows. These bring up information associated with the command. For example, if you run `cd /?` on Windows, the shell tells you what the `cd` command does and lists other command line arguments for it:

---

```
C:\Users\Al>cd /?
```

```
Displays the name of or changes the current directory.
```

```
CHDIR [/D] [drive:][path]
```

```
CHDIR [..]
```

```
CD [/D] [drive:][path]
```

```
CD [..]
```

```
.. Specifies that you want to change to the parent directory.
```

```
Type CD drive: to display the current directory in the specified drive.
```

```
Type CD without parameters to display the current drive and directory.
```

```
Use the /D switch to change current drive in addition to changing current directory for a drive.
```

```
--snip--
```

---

This help information tells us that the Windows `cd` command also goes by the name `chdir`. (Most people won't type `chdir` when the shorter `cd` command does the same thing.) The square brackets contain optional arguments. For example, `CD [/D] [drive:][path]` tells you that you could specify a drive or path using the `/D` option.

Unfortunately, although the `/?` and `--help` information for commands provides reminders for experienced users, the explanations can often be cryptic. They're not good resources for beginners. You're better off using a book or web tutorial instead, such as *The Linux Command Line*, 2nd Edition (2019) by William Shotts, *Linux Basics for Hackers* (2018) by OccupyTheWeb, or *PowerShell for Sysadmins* (2020) by Adam Bertram, all from No Starch Press.
