

display only the files that end in `.py`. The glob pattern `*.py` means “any group of characters, followed by `.py`”:

```
C:\Users\Al>dir *.py
Volume in drive C is Windows
Volume Serial Number is DFF3-8658

Directory of C:\Users\Al

03/24/2019  10:45 PM                8,399 conwaygameoflife.py
03/24/2019  11:00 PM                7,896 test1.py
10/29/2019  08:18 PM            21,254 wizcoin.py
               3 File(s)            37,549 bytes
               0 Dir(s)  506,300,776,448 bytes free
```

The glob pattern `records201?.txt` means “`records201`, followed by any single character, followed by `.txt`.” This would match record files for the years *records2010.txt* to *records2019.txt* (as well as filenames, such as *records201X.txt*). The glob pattern `records20???.txt` would match any two characters, such as *records2021.txt* or *records20AB.txt*.

Change Directories with `cd`

Running `cd [destination folder]` changes the shell’s cwd to the destination folder:

```
C:\Users\Al>cd Desktop

C:\Users\Al\Desktop>
```

The shell displays the cwd as part of its prompt, and any folders or files used in commands will be interpreted relative to this directory.

If the folder has spaces in its name, enclose the name in double quotes. To change the cwd to the user’s home folder, enter `cd ~` on macOS and Linux, and `cd %USERPROFILE%` on Windows.

On Windows, if you also want to change the current drive, you’ll first need to enter the drive name as a separate command:
