

Similarly, you can import multiple modules with a single `import` statement:

```
import math, os, sys
```

Even so, PEP 8 recommends that you split this statement into one `import` statement per module:

```
import math
import os
import sys
```

If you write separate lines for imports, you'll have an easier time spotting any additions or removals of imported modules when you're comparing changes in a version control system's diff tool. (Version control systems, such as Git, are covered in Chapter 12.)

PEP 8 also recommends grouping `import` statements into the following three groups in this order:

1. Modules in the Python standard library, like `math`, `os`, and `sys`
2. Third-party modules, like Selenium, Requests, or Django
3. Local modules that are a part of the program

These guidelines are optional, and Black won't change the formatting of your code's `import` statements.

Black: The Uncompromising Code Formatter

Black automatically formats the code inside your `.py` files. Although you should understand the formatting rules covered in this chapter, Black can do all the actual styling for you. If you're working on a coding project with others, you can instantly settle many arguments on how to format code by just letting Black decide.

You can't change many of the rules that Black follows, which is why it's described as "the uncompromising code formatter." Indeed, the tool's name comes from Henry Ford's quote about the automobile colors choices he
