

Black also uses double quotes for Python’s triple-quoted, multiline strings ③.

But if you want Black to leave your string literals as you wrote them and not change the type of quotes used, pass it the `-s` command line option. (Note that the `S` is uppercase.) For example, running Black on the original *yourScript.py* file in Windows would produce the following output:

```
C:\Users\Al>python -m black -S yourScript.py
All done!
1 file left unchanged.
```

You can also use the `-l` line length limit and `-s` options in the same command:

```
C:\Users\Al>python -m black -l 120 -S yourScript.py
```

Previewing the Changes Black Will Make

Although Black won’t rename your variable or change your program’s behavior, you might not like the style changes Black makes. If you want to stick to your original formatting, you could either use version control for your source code or maintain your own backups. Alternatively, you can preview the changes Black would make without letting it actually alter your files by running Black with the `--diff` command line option. In Windows, it looks like this:

```
C:\Users\Al>python -m black --diff yourScript.py
```

This command outputs the differences in the diff format commonly used by version control software, but it’s generally readable by humans. For example, if *yourScript.py* contains the line `weights=[42.0,3.1415,2.718]`, running the `--diff` option would display this result:

```
C:\Users\Al>python -m black --diff yourScript.py
--- yourScript.py      2020-12-07 02:04:23.141417 +0000
+++ yourScript.py      2020-12-07 02:08:13.893578 +0000
