

```

else:
    ❷ username = get_new_username(path)
      print(f"We'll remember you when you come back, {username}!")

greet_user()

```

Each function in this final version of *remember_me.py* has a single, clear purpose. We call `greet_user()`, and that function prints an appropriate message: it either welcomes back an existing user or greets a new user. It does this by calling `get_stored_username()` ❶, which is responsible only for retrieving a stored username if one exists. Finally, if necessary, `greet_user()` calls `get_new_username()` ❷, which is responsible only for getting a new username and storing it. This compartmentalization of work is an essential part of writing clear code that will be easy to maintain and extend.

TRY IT YOURSELF

10-11. Favorite Number: Write a program that prompts for the user's favorite number. Use `json.dumps()` to store this number in a file. Write a separate program that reads in this value and prints the message "I know your favorite number! It's ____."

10-12. Favorite Number Remembered: Combine the two programs you wrote in Exercise 10-11 into one file. If the number is already stored, report the favorite number to the user. If not, prompt for the user's favorite number and store it in a file. Run the program twice to see that it works.

10-13. User Dictionary: The *remember_me.py* example only stores one piece of information, the username. Expand this example by asking for two more pieces of information about the user, then store all the information you collect in a dictionary. Write this dictionary to a file using `json.dumps()`, and read it back in using `json.loads()`. Print a summary showing exactly what your program remembers about the user.

10-14. Verify User: The final listing for *remember_me.py* assumes either that the user has already entered their username or that the program is running for the first time. We should modify it in case the current user is not the person who last used the program.

Before printing a welcome back message in `greet_user()`, ask the user if this is the correct username. If it's not, call `get_new_username()` to get the correct username.
