

Installing pytest

Now that pip is up to date, we can install pytest:

```
$ python -m pip install --user pytest
Collecting pytest
--snip--
Successfully installed attrs-21.4.0 iniconfig-1.1.1 ...pytest-7.x.x
```

We're still using the core command `pip install`, without the `--upgrade` flag this time. Instead, we're using the `--user` flag, which tells Python to install this package for the current user only. The output shows that the latest version of pytest was successfully installed, along with a number of other packages that pytest depends on.

You can use this command to install many third-party packages:

```
$ python -m pip install --user package_name
```

NOTE

If you have any difficulty running this command, try running the same command without the `--user` flag.

Testing a Function

To learn about testing, we need code to test. Here's a simple function that takes in a first and last name, and returns a neatly formatted full name:

```
name def get_formatted_name(first, last):
_function.py """Generate a neatly formatted full name."""
    full_name = f"{first} {last}"
    return full_name.title()
```

The function `get_formatted_name()` combines the first and last name with a space in between to complete a full name, and then capitalizes and returns the full name. To check that `get_formatted_name()` works, let's make a program that uses this function. The program `names.py` lets users enter a first and last name, and see a neatly formatted full name:

```
names.py from name_function import get_formatted_name

print("Enter 'q' at any time to quit.")
while True:
    first = input("\nPlease give me a first name: ")
    if first == 'q':
        break
    last = input("Please give me a last name: ")
    if last == 'q':
        break

    formatted_name = get_formatted_name(first, last)
    print(f"\tNeatly formatted name: {formatted_name}."
```
