

```

class AlienInvasion:
    """Overall class to manage game assets and behavior."""

    def __init__(self):
        --snip--
        pygame.display.set_caption("Alien Invasion")

    ❶ self.ship = Ship(self)

    def run_game(self):
        --snip--
        # Redraw the screen during each pass through the loop.
        self.screen.fill(self.settings.bg_color)
    ❷ self.ship.blitme()

        # Make the most recently drawn screen visible.
        pygame.display.flip()
        self.clock.tick(60)
--snip--

```

We import `Ship` and then make an instance of `Ship` after the screen has been created ❶. The call to `Ship()` requires one argument: an instance of `AlienInvasion`. The `self` argument here refers to the current instance of `AlienInvasion`. This is the parameter that gives `Ship` access to the game's resources, such as the screen object. We assign this `Ship` instance to `self.ship`.

After filling the background, we draw the ship on the screen by calling `ship.blitme()`, so the ship appears on top of the background ❷.

When you run *alien_invasion.py* now, you should see an empty game screen with the rocket ship sitting at the bottom center, as shown in Figure 12-2.

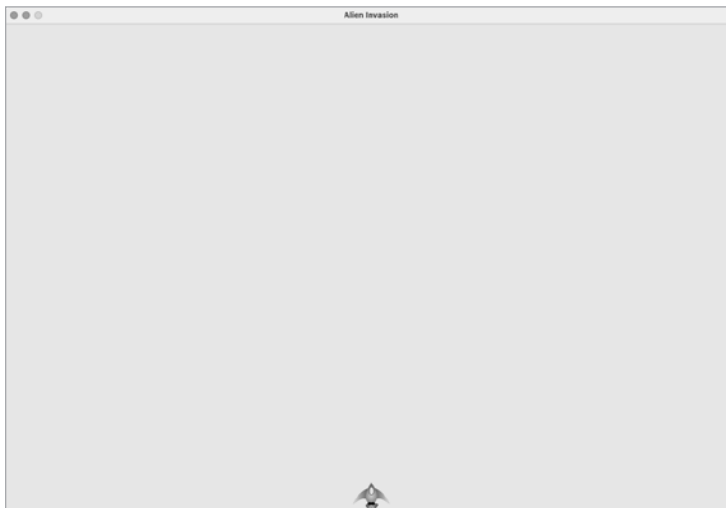

Figure 12-2: Alien Invasion with the ship at the bottom center of the screen
