

We call `prep_score()` after resetting the game stats when starting a new game. This preps the scoreboard with a score of 0.

Making Sure to Score All Hits

As currently written, our code could miss scoring for some aliens. For example, if two bullets collide with aliens during the same pass through the loop or if we make an extra-wide bullet to hit multiple aliens, the player will only receive points for hitting one of the aliens. To fix this, let's refine the way that bullet-alien collisions are detected.

In `_check_bullet_alien_collisions()`, any bullet that collides with an alien becomes a key in the collisions dictionary. The value associated with each bullet is a list of aliens it has collided with. We loop through the values in the collisions dictionary to make sure we award points for each alien hit:

```
alien_invasion.py    def _check_bullet_alien_collisions(self):
                    --snip--
                    if collisions:
                        for aliens in collisions.values():
                            self.stats.score += self.settings.alien_points * len(aliens)
                        self.sb.prep_score()
                    --snip--
```

If the collisions dictionary has been defined, we loop through all values in the dictionary. Remember that each value is a list of aliens hit by a single bullet. We multiply the value of each alien by the number of aliens in each list and add this amount to the current score. To test this, change the width of a bullet to 300 pixels and verify that you receive points for each alien you hit with your extra-wide bullets; then return the bullet width to its normal value.

Increasing Point Values

Because the game gets more difficult each time a player reaches a new level, aliens in later levels should be worth more points. To implement this functionality, we'll add code to increase the point value when the game's speed increases:

```
settings.py    class Settings:
                """A class to store all settings for Alien Invasion."""

                def __init__(self):
                    --snip--
                    # How quickly the game speeds up
                    self.speedup_scale = 1.1
                    # How quickly the alien point values increase
                    ❶ self.score_scale = 1.5

                    self.initialize_dynamic_settings()

                def initialize_dynamic_settings(self):
                    --snip--
```
