

commas at appropriate places in the numerical value that's provided. This results in strings like 1,000,000 instead of 1000000.

Now when you run the game, you should see a neatly formatted, rounded score even when you rack up lots of points, as shown in Figure 14-3.

Figure 14-3: A rounded score with comma separators

High Scores

Every player wants to beat a game's high score, so let's track and report high scores to give players something to work toward. We'll store high scores in `GameStats`:

```
game_stats.py    def __init__(self, ai_game):
                  --snip--
                  # High score should never be reset.
                  self.high_score = 0
```

Because the high score should never be reset, we initialize `high_score` in `__init__()` rather than in `reset_stats()`.

Next, we'll modify `Scoreboard` to display the high score. Let's start with the `__init__()` method:

```
scoreboard.py    def __init__(self, ai_game):
                  --snip--
                  # Prepare the initial score images.
                  self.prep_score()
                  ❶ self.prep_high_score()
```

The high score will be displayed separately from the score, so we need a new method, `prep_high_score()`, to prepare the high-score image ❶.
