

Figure 15-13: A simple bar chart created with Plotly

Rolling Two Dice

Rolling two dice results in larger numbers and a different distribution of results. Let's modify our code to create two D6 dice to simulate the way we roll a pair of dice. Each time we roll the pair, we'll add the two numbers (one from each die) and store the sum in results. Save a copy of *die_visual.py* as *dice_visual.py* and make the following changes:

```

dice_visual.py import plotly.express as px

from die import Die

# Create two D6 dice.
die_1 = Die()
die_2 = Die()

# Make some rolls, and store results in a list.
results = []
for roll_num in range(1000):
    ❶ result = die_1.roll() + die_2.roll()
    results.append(result)

# Analyze the results.
frequencies = []
    ❷ max_result = die_1.num_sides + die_2.num_sides
    ❸ poss_results = range(2, max_result+1)
    for value in poss_results:
        frequency = results.count(value)
        frequencies.append(frequency)

```
