

Figure 17-1: The most-starred Python projects on GitHub

Styling the Chart

Plotly supports a number of ways to style and customize the plots, once you know the information in the plot is correct. We'll make some changes in the initial `px.bar()` call and then make some further adjustments to the `fig` object after it's been created.

We'll start styling the chart by adding a title and labels for each axis:

```
python_repos
_visual.py

--snip--
# Make visualization.
title = "Most-Starred Python Projects on GitHub"
labels = {'x': 'Repository', 'y': 'Stars'}
fig = px.bar(x=repo_names, y=stars, title=title, labels=labels)

❶ fig.update_layout(title_font_size=28, xaxis_title_font_size=20,
                    yaxis_title_font_size=20)

fig.show()
```

We first add a title and labels for each axis, as we did in Chapters 15 and 16. We then use the `fig.update_layout()` method to modify specific elements of the chart ❶. Plotly uses a convention where aspects of a chart element are connected by underscores. As you become familiar with Plotly's documentation, you'll start to see consistent patterns in how different elements of a chart are named and modified. Here we set the title font size to 28 and the font size for each axis title to 20. The result is shown in Figure 17-2.
