You would use a similar process to access and analyze information with any API. With this data, you could make a visualization showing which submissions have inspired the most active recent discussions. This is also the basis for apps that provide a customized reading experience for sites like Hacker News. To learn more about what kind of information you can access through the Hacker News API, visit the documentation page at <https://github.com/HackerNews/API>.

NOTE

Hacker News sometimes allows companies it supports to make special hiring posts, and comments are disabled on these posts. If you run this program while one of these posts is present, you'll get a `KeyError`. If this causes an issue, you can wrap the code that builds `submission_dict` in a `try-except` block and skip over these posts.

TRY IT YOURSELF

17-1. Other Languages: Modify the API call in `python_repos.py` so it generates a chart showing the most popular projects in other languages. Try languages such as *JavaScript, Ruby, C, Java, Perl, Haskell, and Go*.

17-2. Active Discussions: Using the data from `hn_submissions.py`, make a bar chart showing the most active discussions currently happening on Hacker News. The height of each bar should correspond to the number of comments each submission has. The label for each bar should include the submission's title and act as a link to the discussion page for that submission. If you get a `KeyError` when creating a chart, use a `try-except` block to skip over the promotional posts.
