

```
# Default django apps.
'django.contrib.admin',
--snip--
]
--snip--
```

Grouping apps together in a project helps keep track of them as the project grows to include more apps. Here we start a section called `My apps`, which includes only `'learning_logs'` for now. It's important to place your own apps before the default apps, in case you need to override any behavior of the default apps with your own custom behavior.

Next, we need to tell Django to modify the database so it can store information related to the model `Topic`. From the terminal, run the following command:

```
(ll_env)learning_log$ python manage.py makemigrations learning_logs
Migrations for 'learning_logs':
  learning_logs/migrations/0001_initial.py
    - Create model Topic
(ll_env)learning_log$
```

The command `makemigrations` tells Django to figure out how to modify the database so it can store the data associated with any new models we've defined. The output here shows that Django has created a migration file called `0001_initial.py`. This migration will create a table for the model `Topic` in the database.

Now we'll apply this migration and have Django modify the database for us:

```
(ll_env)learning_log$ python manage.py migrate
Operations to perform:
  Apply all migrations: admin, auth, contenttypes, learning_logs, sessions
Running migrations:
  Applying learning_logs.0001_initial... OK
```

Most of the output from this command is identical to the output from the first time we issued the `migrate` command. We need to check the last line in this output, where Django confirms that the migration for `learning_logs` worked OK.

Whenever we want to modify the data that Learning Log manages, we'll follow these three steps: modify `models.py`, call `makemigrations` on `learning_logs`, and tell Django to migrate the project.

The Django Admin Site

Django makes it easy to work with your models through its admin site. Django's *admin site* is only meant to be used by the site's administrators; it's not meant for regular users. In this section, we'll set up the admin site and use it to add some topics through the `Topic` model.
