

Migrating the Entry Model

Because we've added a new model, we need to migrate the database again. This process will become quite familiar: you modify *models.py*, run the command `python manage.py makemigrations app_name`, and then run the command `python manage.py migrate`.

Migrate the database and check the output by entering the following commands:

```
(ll_env)learning_log$ python manage.py makemigrations learning_logs
Migrations for 'learning_logs':
❶  learning_logs/migrations/0002_entry.py
    - Create model Entry
(ll_env)learning_log$ python manage.py migrate
Operations to perform:
  --snip--
❷  Applying learning_logs.0002_entry... OK
```

A new migration called *0002_entry.py* is generated, which tells Django how to modify the database to store information related to the model Entry ❶. When we issue the migrate command, we see that Django applied this migration and everything worked properly ❷.

Registering Entry with the Admin Site

We also need to register the Entry model. Here's what *admin.py* should look like now:

```
admin.py from django.contrib import admin

from .models import Topic, Entry

admin.site.register(Topic)
admin.site.register(Entry)
```

Go back to <http://localhost/admin/>, and you should see Entries listed under *Learning_Logs*. Click the **Add** link for Entries, or click **Entries** and then choose **Add entry**. You should see a drop-down list to select the topic you're creating an entry for and a text box for adding an entry. Select **Chess** from the drop-down list, and add an entry. Here's the first entry I made:

The opening is the first part of the game, roughly the first ten moves or so. In the opening, it's a good idea to do three things—bring out your bishops and knights, try to control the center of the board, and castle your king.

Of course, these are just guidelines. It will be important to learn when to follow these guidelines and when to disregard these suggestions.

When you click **Save**, you'll be brought back to the main admin page for entries. Here, you'll see the benefit of using `text[:50]` as the string representation for each entry; it's much easier to work with multiple entries in
