

is part of `learning_logs`, so we include `learning_logs` in the path to the parent template. This line pulls in everything contained in the `base.html` template and allows `index.html` to define what goes in the space reserved by the content block.

We define the content block by inserting a `{% block %}` tag with the name `content` ❷. Everything that we aren't inheriting from the parent template goes inside the content block. Here, that's the paragraph describing the Learning Log project. We indicate that we're finished defining the content by using an `{% endblock content %}` tag ❸. The `{% endblock %}` tag doesn't require a name, but if a template grows to contain multiple blocks, it can be helpful to know exactly which block is ending.

You can start to see the benefit of template inheritance: in a child template, we only need to include content that's unique to that page. This not only simplifies each template, but also makes it much easier to modify the site. To modify an element common to many pages, you only need to modify the parent template. Your changes are then carried over to every page that inherits from that template. In a project that includes tens or hundreds of pages, this structure can make it much easier and faster to improve your site.

In a large project, it's common to have one parent template called `base.html` for the entire site and parent templates for each major section of the site. All the section templates inherit from `base.html`, and each page in the site inherits from a section template. This way you can easily modify the look and feel of the site as a whole, any section in the site, or any individual page. This configuration provides a very efficient way to work, and encourages you to steadily update your project over time.

The Topics Page

Now that we have an efficient approach to building pages, we can focus on our next two pages: the general topics page and the page to display entries for a single topic. The topics page will show all topics that users have created, and it's the first page that will involve working with data.

The Topics URL Pattern

First, we define the URL for the topics page. It's common to choose a simple URL fragment that reflects the kind of information presented on the page. We'll use the word *topics*, so the URL `http://localhost:8000/topics/` will return this page. Here's how we modify `learning_logs/urls.py`:

```
learning_logs/ """Defines URL patterns for learning_logs."""
urls.py      --snip--
urlpatterns = [
    # Home page
    path('', views.index, name='index'),
    # Page that shows all topics.
    path('topics/', views.topics, name='topics'),
]
```
