

The new_topic URL

The URL for a new page should be short and descriptive. When the user wants to add a new topic, we'll send them to *http://localhost:8000/new_topic/*. Here's the URL pattern for the new_topic page; add this to *learning_logs/urls.py*:

```
learning_logs/urls.py  --snip--
                        urlpatterns = [
                        --snip--
                        # Page for adding a new topic.
                        path('new_topic/', views.new_topic, name='new_topic'),
                        ]
```

This URL pattern sends requests to the view function `new_topic()`, which we'll write next.

The new_topic() View Function

The `new_topic()` function needs to handle two different situations: initial requests for the new_topic page, in which case it should show a blank form; and the processing of any data submitted in the form. After data from a submitted form is processed, it needs to redirect the user back to the topics page:

```
views.py  from django.shortcuts import render, redirect

           from .models import Topic
           from .forms import TopicForm

           --snip--
           def new_topic(request):
               """Add a new topic."""
               ❶ if request.method != 'POST':
                   # No data submitted; create a blank form.
                   ❷ form = TopicForm()
               else:
                   # POST data submitted; process data.
                   ❸ form = TopicForm(data=request.POST)
                   ❹ if form.is_valid():
                       ❺ form.save()
                       ❻ return redirect('learning_logs:topics')

               # Display a blank or invalid form.
               ❼ context = {'form': form}
               return render(request, 'learning_logs/new_topic.html', context)
```

We import the function `redirect`, which we'll use to redirect the user back to the topics page after they submit their topic. We also import the form we just wrote, `TopicForm`.
