

We update the `import` statement to include the `EntryForm` we just made. The definition of `new_entry()` has a `topic_id` parameter to store the value it receives from the URL. We'll need the topic to render the page and process the form's data, so we use `topic_id` to get the correct topic object ❶.

Next, we check whether the request method is `POST` or `GET` ❷. The `if` block executes if it's a `GET` request, and we create a blank instance of `EntryForm` ❸.

If the request method is `POST`, we process the data by making an instance of `EntryForm`, populated with the `POST` data from the request object ❹. We then check whether the form is valid. If it is, we need to set the entry object's topic attribute before saving it to the database. When we call `save()`, we include the argument `commit=False` ❺ to tell Django to create a new entry object and assign it to `new_entry`, without saving it to the database yet. We set the topic attribute of `new_entry` to the topic we pulled from the database at the beginning of the function ❻. Then we call `save()` with no arguments, saving the entry to the database with the correct associated topic.

The `redirect()` call requires two arguments: the name of the view we want to redirect to and the argument that view function requires ❼. Here, we're redirecting to `topic()`, which needs the argument `topic_id`. This view then renders the topic page that the user made an entry for, and they should see their new entry in the list of entries.

At the end of the function, we create a context dictionary and render the page using the `new_entry.html` template. This code will execute for a blank form, or for a form that's been submitted but turns out to be invalid.

The `new_entry` Template

As you can see in the following code, the template for `new_entry` is similar to the template for `new_topic`:

```
new_entry.html  {% extends "learning_logs/base.html" %}

                {% block content %}

❶  <p><a href="{% url 'learning_logs:topic' topic.id %}">{{ topic }}</a></p>

    <p>Add a new entry:</p>
❷  <form action="{% url 'learning_logs:new_entry' topic.id %}" method='post'>
    {% csrf_token %}
    {{ form.as_div }}
    <button name='submit'>Add entry</button>
    </form>

                {% endblock content %}
```

We show the topic at the top of the page ❶, so the user can see which topic they're adding an entry to. The topic also acts as a link back to the main page for that topic.
