

```
# Default django apps.
--snip--
]
--snip--
```

Now Django will include the accounts app in the overall project.

Including the URLs from accounts

Next, we need to modify the root *urls.py* so it includes the URLs we'll write for the accounts app:

```
ll_project/urls.py from django.contrib import admin
from django.urls import path, include

urlpatterns = [
    path('admin/', admin.site.urls),
    path('accounts/', include('accounts.urls')),
    path('', include('learning_logs.urls')),
]
```

We add a line to include the file *urls.py* from accounts. This line will match any URL that starts with the word *accounts*, such as *http://localhost:8000/accounts/login/*.

The Login Page

We'll first implement a login page. We'll use the default login view Django provides, so the URL pattern for this app looks a little different. Make a new *urls.py* file in the directory *ll_project/accounts/* and add the following to it:

```
accounts/urls.py """Defines URL patterns for accounts."""

from django.urls import path, include

app_name = 'accounts'
urlpatterns = [
    # Include default auth urls.
    path('', include('django.contrib.auth.urls')),
]
```

We import the *path* function, and then import the *include* function so we can include some default authentication URLs that Django has defined. These default URLs include named URL patterns, such as 'login' and 'logout'. We set the variable *app_name* to 'accounts' so Django can distinguish these URLs from URLs belonging to other apps. Even default URLs provided by Django, when included in the accounts app's *urls.py* file, will be accessible through the accounts namespace.
