

consistent position below any other content on the page. The form itself has the logout URL as its action argument, and 'post' as the request method ❷. Every form in Django needs to include the {% csrf_token %}, even a simple form like this one. This form is empty except for the submit button.

The LOGOUT_REDIRECT_URL Setting

When the user clicks the logout button, Django needs to know where to send them. We control this behavior in *settings.py*:

```
settings.py --snip--
# My settings.
LOGIN_REDIRECT_URL = 'learning_logs:index'
LOGOUT_REDIRECT_URL = 'learning_logs:index'
```

The LOGOUT_REDIRECT_URL setting shown here tells Django to redirect logged-out users back to the home page. This is a simple way to confirm that they were logged out, because they should no longer see their username after logging out.

The Registration Page

Next, we'll build a page so new users can register. We'll use Django's default UserCreationForm, but write our own view function and template.

The register URL

The following code provides the URL pattern for the registration page, which should be placed in *accounts/urls.py*:

```
accounts/urls.py """Defines URL patterns for accounts."""

from django.urls import path, include

from . import views

app_name = accounts
urlpatterns = [
    # Include default auth urls.
    path('', include('django.contrib.auth.urls')),
    # Registration page.
    path('register/', views.register, name='register'),
]
```

We import the views module from accounts, which we need because we're writing our own view for the registration page. The pattern for the registration page matches the URL *http://localhost:8000/accounts/register/* and sends requests to the register() function we're about to write.
