

where a personalized greeting in the header tells them their registration was successful.

At the end of the function, we render the page, which will be either a blank form or a submitted form that's invalid.

The register Template

Now create a template for the registration page, which will be similar to the login page. Be sure to save it in the same directory as *login.html*:

```
register.html {% extends "learning_logs/base.html" %}

{% block content %}

    <form action="{% url 'accounts:register' %}" method='post'>
        {% csrf_token %}
        {{ form.as_div }}

        <button name="submit">Register</button>
    </form>

{% endblock content %}
```

This should look like the other form-based templates we've been writing. We use the `as_div` method again so Django will display all the fields in the form appropriately, including any error messages if the form isn't filled out correctly.

Linking to the Registration Page

Next, we'll add code to show the registration page link to any user who isn't currently logged in:

```
base.html --snip--
    {% if user.is_authenticated %}
        Hello, {{ user.username }}.
    {% else %}
        <a href="{% url 'accounts:register' %}">Register</a> -
        <a href="{% url 'accounts:login' %}">Log in</a>
    {% endif %}
--snip--
```

Now users who are logged in see a personalized greeting and a logout button. Users who aren't logged in see a registration link and a login link. Try out the registration page by making several user accounts with different usernames.

In the next section, we'll restrict some of the pages so they're available only to registered users, and we'll make sure every topic belongs to a specific user.
