

Viewing the Live Project

Once the push is complete, you can open the project:

```
(ll_env)learning_log$ platform url
Enter a number to open a URL
[0] https://main-bvxea6i-wmye2fx7wwqgu.us-3.platformsh.site/
--snip--
> 0
```

The platform `url` command lists the URLs associated with a deployed project; you'll be given a choice of several URLs that are all valid for your project. Choose one, and your project should open in a new browser tab! This will look just like the project we've been running locally, but you can share this URL with anyone in the world, and they can access and use your project.

NOTE

When you deploy your project using a trial account, don't be surprised if it sometimes takes longer than usual for a page to load. On most hosting platforms, free resources that are idle are often suspended and only restarted when new requests come in. Most platforms are much more responsive on paid hosting plans.

Refining the Platform.sh Deployment

Now we'll refine the deployment by creating a superuser, just as we did locally. We'll also make the project more secure by changing the setting `DEBUG` to `False`, so error messages won't show users any extra information that they could use to attack the server.

Creating a Superuser on Platform.sh

The database for the live project has been set up, but it's completely empty. All the users we created earlier only exist in our local version of the project.

To create a superuser on the live version of the project, we'll start an SSH (secure socket shell) session where we can run management commands on the remote server:

```
(ll env)learning log$ platform environment:ssh
```
